DETAILED ACTION

Allowable Subject Matter

Claims 1-4 and 6-12 are allowed. For the purposes of allowance, the original numbering of the claims has been changed.

The following is an examiner's statement of reasons for allowance:

The general concept of mounting microphones on a diffracting object in order to obtain a high directivity gain was known in the art at the time of the invention, as evidenced by the Stinson et al (US 7,068,801 B1) reference. However, the Examiner has not found prior art that teaches or suggests the modification of Stinson in order to provide a low frequency beamformer in combination with a microphone array diffracting structure, wherein linear constraints are applied to the beamformer using two symmetrical look directions with a gain constraint less than one and wherein the spacing is controlled by α which increases with frequency, for providing a smooth transition between said low and high frequency directivity responses as defined in the independent claims 1, 10 and 12. Other prior art has been cited herein regarding microphone diffracting structures and beamformers, however the other prior art of record also fails to teach or provide suggestion to arrive the combination of the elements and steps presented in the independent claims, again when said elements or steps are collectively considered in regards to each claim. For at least the reasons listed above, the dependent claims are also allowed in view of their respective dependencies upon the independent claims.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Dedieu et al (US 7,269,263 B2) discloses a method of broadband constant directivity beamforming for non-linear and non axis-symmetric sensor arrays embedded in an obstacle.

Elko (US 5,742,693) discloses image derived second-order directional microphones with finite baffle.
